March 2016

Our Amphibious excavator is specially designed to work in swampy, wet land and shallow water. Our amphibious excavator has been proven to work effectively in land reclamation by our clients. In November 2015, KSML Sdn Bhd (Malaysia) is honour to be awarded the contract to undertake construction of St.Regis Langkawi man-made lagoon and break water in the exotic and beautiful island of Langkawi in the state of Kedah, Malaysia. It is going to be a challenging project ever as it is world first man-made lagoon for St. Regis Hotel group in Asia.

Two unit of Ultratrex amphibious excavator (Model: AT200ER) are being used efficiently in their project. One amphibious excavator is responsible for scrapping upper layer of mud from sea bed along the beach. Another unit of amphibious excavator is attached with our Bell Cutter Suction Dredging Pump (Bell 200). KSML Sdn Bhd is impressed by the high productivity of the Bell pump. Our customer is able to pump 300m³/hour of sand to their expected discharge distance.

For break water construction, natural rock and concrete are required to build into the sea to protect the shore from the waves. Amphibious excavator comes with long reach arm can provide the best solution and great mobility to perform the job in the shallow water where the dredger and conventional excavator are not qualified.

Therefore, we trust that Ultratrex amphibious excavator is the best solution in your mind whenever you encounter the challenges in shallow dredging construction project.
