In July, our East Malaysia customer utilized Ultratrex Amphibious Excavator in pipe laying project on the seabed along the shoreline. Ultratrex AT200ER amphibious excavator is equipped with additional side pontoon and 6 meter hydraulic spuds to ensure the stability and floatation during the excavation process.

For this project, rock cutter is attached to cutting rocks on the seabed. After the cutting process, the rocks are removed and standard bucket is attached to excavate trenches on the seabed. Lastly, the laying & installation of fibre optic cables commence from there.

## Study Time

Continuous educational to improve our products quality and for employee's career development.

## Proactive Human Resources

In July 2016, There are 2 initiatives from our production team. The development of a rotating jig of slewing frame and hydraulic piping. With this new development, our production team is able to work more efficient & effective. Besides, improving the welding work process. It also helps the production team to improve the quality of the product.

The combination of new ideas from our new and experiences engineers with their brilliant ideas, the rotating jigs able to fulfill our production team requirement and safety features toward OSHA 18001

Hydraulic Piping Jig

Slewing Frame Jig

Before using slewing frame jig, our production team taking 20 hours to complete welding process, but after using this jig our production team only take 8 hours to complete it & with improved quality.
